

[MyComments](#) API documentation

How does it work?

Is the same idea used to submit a **trackback**, this means, send information to another server without waiting a confirmation.

What data should I send?

For each comment, you have to send this data, respecting the attributes names:

Attribute	Obligatory	Description
blogName	★	Blog name
blogUrl	★	Blog URL
PostTitle	★	The post title
postID	★	The post ID
postUrl	★	The post URL
commentAuthor	★	The comment author's name
commentEmail	★	The comment author's email
commentUrl	★	The comment author's website
commentContent	★	The comment itself

How to send the data?

The server is waiting for this data using the POST method.

Where to send the data?

To this URL:

<http://mycomments.idslab.com.ar/app/ping.php>

That's all, for any kind of questions, my email is: dfgonzalez@gmail.com
